ACKNOWLEDGEMENT

The author acknowledges that the completion of this thesis would not have been possible without the opportunity, rigorous technical guidance and most importantly, the motivation provided by Dr. Steven McDougall throughout the duration of my PhD research. I sincerely thank him for his pivotal role in helping me realise this life-long dream.

I would like to thank Dr. Steven Webb and Dr. Helen Lewis for accepting to serve as my examiners. Many thanks to Dr. Eric Mackay who always spared his precious time and patiently offered phenomenal advice that helped me overcome a number of challenging personal experiences. He is also thanked for his enlightening technical overview regarding micromodel experiments of depressurisation studies. I also like to thank Dr. Rink van Dijke for carefully reviewing some of my work and providing important suggestions. Thanks also to all the colleagues and friends that I met during the past three and half years especially Hooman Haghighi and Antonin Chapoy for ensuring that football games were booked weekly, Murtala Muhammed for his selfless assistance during the final stages of my work. I also sincerely thank the computer support group of the department for promptly responding to my requests at key moments.

Without the financial support provided by Total E&P UK Ltd., this research would not have been carried out. The author remains highly appreciative of this gesture. All the ideas and invaluable discussions with Dr. Igor Bondino and Dr. Gerald Hamon are also thankfully acknowledged.

I would like to thank my family; special thanks to my mum, Mrs. Theresa Ezeuko for her patience and prayers, Chief Chris and Lolo Edna Umeh for both their motivation and financial support. Finally, my wife Uche is affectionately acknowledged for her patience, optimism, and support throughout the duration of my research.
